Lasers intrinsically involve both gain and loss, which makes them the natural candidates to explore and exploit parity-time symmetry in photonics. Recent studies have demonstrated various novel laser devices based on parity-time symmetry, which show unique properties such as single mode lasing, chiral mode lasing, and exceptional point enhanced sensing.

Laser is a device that amplifies or increases the intensity of light and produces highly directional light. Laser not only amplifies or increases the intensity of light but also generates the light. Laser emits light through a process called stimulated emission of radiation which amplifies or increases the intensity of light.

Some lasers, such as ruby lasers, emit short pulses of light. Others, like helium–neon gas lasers or liquid dye lasers, emit light that is continuous. NIF, like the ruby laser, emits pulses of light lasting only billionths of a second. Laser light does not need to be visible.

298 CHAPTER 7. LASERS of the four level laser, see Figure 7.6. If the relaxation rate  $\gamma_{10}$  is very fast compared to  $\gamma_{21}$ , where the laser action should occur inversion can be achieved, i.e.  $N_2 > N_1$ . For the four level laser the relaxation rate  $\gamma_{32}$  should also be fast in comparison to  $\gamma_{21}$ . These systems are easy to analyze in the rate
