In europe we design a pad eye according to the formula of bleich or poocha. This is an very fine tuned method. How ever our customer in America wants it calculated acc to. AISC 9 th edition ASD or an american regulation. I can not find a chapter in the AISC 9 th edition ASD, which copes with a pad eye design, where an engineer can calculate, the average stress in the padeye, surface stress from the shaft in the hole, the eye stress and the shear stress in teh pad eye.

Design/Evaluation of Overhead Lifting Lugs Page 7 1. As discussed in Reference 1, using a "factor" of 1.8 on AISC allowables results in a factor of safety of 5 for A36 steel. This is in line with ASME B30.20 which requires a design factor of 3 on yield strength and ANSI N14.6 which requires a design factor of 3 on yield strength and 5 on ultimate

design procedures for you. ASME BTH-1 uses the 4t limit (Equation 3-46) that was shown in the 1989 AISC Specification but also includes a stability check when determining the effective width of the plate (Equation 3-47). I am sure there are other differences between the AISC and ASME documents, but these are the ones that come immediately to mind.

Padeye geometry and weld size and types were modified based on the initial design review. The current padeye geometry maximizes the load rating capacity while maintaining adequate room in the bow of the shackle for attaching rigging. This report provides the results of the complete evaluation of each padeye and updated cautions and warnings.

Design and Construction of Lifting Beams DAVID T. RICKER
Lifting beams (also known as spreader beams) are used to assist in the hoisting process. Most erectors and riggers accumulate an assortment of lifting beams during the course of time. Some common profiles are shown in Fig. 1. The basic lifting beam is shown in Fig. 1A. This

The App calculates the stress state in the padeye based on elastic AISC code. A scaled working page is used to analyse the stress state based on shackle position. It simultaneously calculates the stress state during simulation of the shackle position and magnitude of the force. It warns the user if the UF (Utilisation Factors) exceed unity.

The Air Force Method of lug analysis is widely used in industry and is documented in the Stress Analysis Manual of the Air Force Flight Dynamics Laboratory (FDL). This method follows closely with the methods presented in Melcon & Hoblit and Bruhn, and it relies heavily on curves generated by empirical data. Although this method is somewhat more complex than other lug analysis methods, it is ...
