Basic Physics Problems And Solutions

Kinematic equations relate the variables of motion to one another. Each equation contains four variables. The variables include acceleration (a), time (t), displacement (d), final velocity (vf), and initial velocity (vi). If values of three variables are known, then the others can be calculated using the equations. This page demonstrates the process with 20 sample problems and accompanying ...

Collisions – problems and solutions. 1. Object A (3 kg) moves at a speed of 8 m/s and object B (5 kg) moves at a speed of 4 m/s. If the collision between the object A and B is perfectly elastic, what is the velocity of object A and B after the collision? Known : Mass of object A (m_1) = 3 kg. Mass of object B (m_2) = 5 kg. The speed of object A (v_1) = 8 ms⁻¹

Free solved physics problems: kinematics. 1. Kinematics: In Kinematics we describe the motion only. We either know the velocity or acceleration, or the dependence of velocity on time or acceleration on time, but we need to find something else about this motion.

The way to solve a complex problem is to break it down into a series of simpler problems. Be careful not to lose sight of your goal among all the bits and pieces, however. Before beginning plot your course. In this case we'll start by finding the effective resistance of the entire circuit and the current from the battery.
