Interventional Pain Medicine

Interventional pain management is a discipline in pain management that is rooted in the goal to help patients relieve their pain. These specialized pain doctors look beyond medication to help someone deal with pain. They rely instead on a vast array of therapies to help diagnose, reduce, and if possible, completely relieve a person's pain.

What Is Interventional Pain Management?

Interventional pain management or interventional pain medicine is a medical subspecialty which treats pain with invasive interventions such as facet joint injections, nerve blocks (interrupting the flow of pain signals along specific nervous system pathways), neuroaugmentation (including spinal cord stimulation and peripheral nerve stimulation), vertebroplasty, kyphoplasty, nucleoplasty, endoscopic discectomy, and implantable drug delivery systems.
